IDEATION PHASE

Empathize & Discover

Date	03 October 2026
Team ID	SWTID-2026-6390
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	4 Marks

Empathy Map Canvas

An empathy map helps the team understand what a user hears, thinks, sees, says and does, along with the problems and benefits they experience. This map is made for the main user of the project: the EEE branch user who has the bb1 role.

HEARS • The administrator saying that bb1 gives READ access only • Instructions that bb2, bb3 and bb4 are needed to create, edit and delete • Classmates saying some records or buttons are not visible to them • Reminders that data must stay protected	**THINKS & FEELS** • "I should be able to see my EEE records." • Wants to feel sure that other branch data is kept away from them • Feels worried or confused if a record suddenly disappears • Feels relieved when the access rules work as expected
SEES • The Institution Details list showing only EEE records • Branch values such as EEE, ECE and CSE in the data • Edit, New and Delete options missing when the roles are not assigned • An empty list when READ access is denied	**SAYS & DOES** • Opens the Institution Details list after logging in • Tries to add, edit or delete a record and notes what is allowed • Tells the administrator when a record or action is missing • Follows the access given by the assigned role
PAINS • Not being able to find a record they need • Not knowing why an action is blocked • Fear of accidentally viewing or changing data outside their branch • Waiting for the administrator to fix a missing role	**GAINS** • Easy access to the EEE records they are allowed to read • Confidence that ECE and CSE records stay protected • Clear idea of which role allows which operation • Trust in the system because the rules behave the same each time

User / Context

User: EEE branch user
Role: bb1 (READ access)
Table: Institution Details
Access focus: Branch = EEE records, with administrators keeping full access
Other roles in the setup: bb2 (CREATE), bb3 (WRITE), bb4 (DELETE)

Key Empathy Insights

- The user wants access that is useful and predictable: they should see the EEE records their bb1 role allows, and nothing more.
- A strict rule can feel frustrating if the user does not know why something is blocked, so role purposes should be explained clearly.
- The administrator needs a simple role-to-operation list (bb1 READ, bb2 CREATE, bb3 WRITE, bb4 DELETE) to set up and test access without mistakes.
- The project responds to these needs with the Branch = EEE READ condition with an ACL script, separate CREATE/WRITE/DELETE ACLs, and testing through impersonation.
